

5.3 Balance: sensibility reciprocal is 0.1 mg and 0.01 g.

5.4 Homogenizer.

5.5 Shaker.

5.6 Nitrogen evaporator.

6 Procedure

6.1 Extraction and Clean-up

A 10 g finely shattered sub-sample was placed in a polypropylene centrifuge tube (100 mL) and 6.0 g magnesium sulfate anhydrous, 1.5 g sodium acetate anhydrous were added. 20 mL acetonitrile (comprising 0.1% acetic acid) was then added to the centrifuge tube and homogenized for 2 min. After which, the sample was centrifuged at 10,000 rpm for 10 min. The supernatant was evaporated to almost dry by a rotary vacuum evaporator under 40 °C, and completely dried up by blowing nitrogen. Residues were dissolved into 2 mL acetonitrile. The solution then transferred to another centrifuge tube which containing 200 mg C18, 150 mg PSA. The mixture was vortexed for 2 min, followed by centrifugation at 5,000 rpm for 3 min. The supernatant was taken with a syringe and filtrated through a 0.45 µm membrane prior to its injection into the GC-MS system.

6.2 Determination

6.2.1 GC-MS operating conditions

GC-MS operating conditions is as following:

- a) Column: RTX-5MS (30 m × 0.25 mm × 0.25 µm) capillary column ¹⁾ or equivalent;
- b) Oven temperature: start at 50 °C (hold 2 min), 50 °C ~ 170 °C at 25 °C/min, 170 °C ~ 230 °C at 2 °C/min, 230 °C ~ 280 °C at 10 °C/min(hold 8 min);
- c) Injection volume: 1 µL;
- d) Carrier gas: helium, purity ≥ 99.999%, flow rate: 1.0 mL/min;
- e) Injection temperature: 270 °C ;

1) RTX-5MS quartzcapillary column is the commercial name which provided by the RTX company. This information only mentioned here for the convenient usage of this standard, and is not a recommendation or endorsement of the product. Other products can be used as well if they have similar effects.

- f) Injection mode: splitless;
- g) NCI source temperature: 200 °C ; Reaction gas: methane, purity ≥99.999% , flow rate: 2.0 mL/min;
- h) Interface temperature: 250 °C ;
- i) Operation method: One quantitative ion and 1-3 qualitative ions of each pesticide were analyzed by ion monitor mode. Retention time, quantitative ion and qualitative ion were shown in annex B. The beginning, stopping time and dwell time of every selected ions can be found in annex C.

6.2.2 Qualitative determination

If the retention time of target peak was within $\pm 0.5\%$ deviation of standard, and the deviation of ion abundance ratio between sample and standard was no more than the ranges shown in table 1 , the pesticide can be determined exist.

Table1 Maximum permitted tolerances for relative ion intensities while confirmation

Relative intensity/%	>50	>20~50	>10~20	≤10
Permitted tolerances/%	± 20	± 25	± 30	± 50

6.2.3 Quantitative determination

To reduce the influence of matrix, we use negative matrix solution to make the matrix mix standard working solution and use external standard to quantify. The response of pesticide in the sample must within the linear range of the matrix mix standard working solution. The GC-MS total ion chromatogram of all the standards solution are shown respectively in annex D.

6.2.4 Parallel test

Parallel test is conducted to the same sample according to the procedure mentioned above.

6.2.5 Blank test

Blank test is conducted according to the procedure performed above without sample addition.

7 Calculation and expression of result

Calculate the residue content of pesticide in the test sample by the data processor of GC-MS, or according to the following formula (1).

$$x_i = \frac{A_i \times c_i \times V}{A_{si} \times m} \quad \dots \dots \dots \quad (1)$$

Where

x_i — The residue content of pesticide in the test sample (mg/kg);

A_1 — The peak area of pesticide in the matrix standard working solution;

c_1 — The concentration of pesticide in the matrix standard working solution(mg/L);

V — The final volume of sample solution(mL):

A_{si} — The peak area of pesticide in the matrix standard working solution;

m — The corresponding mass of test sample in the final sample solution(g).

8 Limit of quantification (LOQ) and recovery

8.1 Limit of quantification

The limit of quantification of the method for 88 pesticide residues in fruits and vegetables such as carrot, cabbage, ginger, apple, pear, peach, strawberry, spinach, watermelon, orange, cowpea and pitaya, etc. was 0.008 mg/kg except the residue of quinoclamine in orange.

8.2 Recovery

Recycling experiments were performed by adding levels of 0.008 mg/kg, 0.020 mg/kg, and 0.040 mg/kg of 88 pesticides to blank samples of carrot, cabbage, ginger, apple, pear, peach, strawberry, spinach, watermelon, cowpea, orange and pitaya recovery rates and precision data of these pesticides in the matrix were shown in annex E.

Annex A
(Normative)

Name, CAS number and other information of 88 pesticides
